

Cleaning and care tips

Use protective foil:

The protective film protects the lining 100% against moisture, atmospheric oxygen and heat. Consistent use of the film protects your rubber and extends its durability.

Regular cleaning:

After each workout or play, clean the rubber with water or special cleaning products (such as GEWO Fair Clean or CONTRA Carbo Cleaner).

Use racket sleeve:

Bat covers effectively protect against harmful light effects and mechanical damage.

Edge band helps against crumbling:

The built-in speed glue effect makes the rubber a bit more brittle than conventional rubbers. On the other hand special edgebandings help.

Protect from cold and heat:

It is important to avoid exposing the racket to high and very low temperatures, so never leave the racket in the car for long periods of time.

More power thanks to the permanently installed gluing effect:

Premium Tension, TENSOR or High Tension rubbers from the factory have a built-in "speed glue effect", which means more speed, spin and sound than conventional rubbers. These rubbers develop their full power immediately.
